Method of locking and unlocking	Locking	: Insert the drawer lock key into the lock and turn it 90 degrees counterclockwise.
	Unlocking	: Insert the drawer lock key into the lock and turn it 90 degrees clockwise.
Key No.	SK1-1	
7. Memory back up

For memory back up, the dry battery ULM-3 (3 pieces) is needed.

1. Memory holding time: Approximate 1 year after NEW dry batteries are inserted.
2. Battery exchange method: When the low battery symbol "L" lights up, batteries (3 pieces) exchange by the following method, within 2 days.

1) Power on the ECR.
2) Turn the MODE SW to "OP X/Z" mode.
3) Release the OLD dry batteries (3 pieces).
4) Insert the NEW dry batteries (3 pieces).
5) Confirm the low battery symbol "L" lights off.

8. One hole cashier key

Standard provision for the TQ, TR, and TS versions of the RE-A330. The KA and the KB version of the ER-A310 and the ER-A330 are treated as service root option.

Number of varieties of keys: 6 (ER-A330)/4 (ER-A310)

CHAPTER 3. SRV RESET AND MASTER RESET

The SRV key is used for operating in the SRV mode.

1. SRV. reset (Program Loop Reset)

Used to return the machine back to its operational state after a lock-up has occurred.

Procedure

• Method 1

1) Turn off the AC switch.

2) Set the mode switch to (SRV') position.

3) Turn on the AC switch.

4) Turn to (SRV) position from (SRV') position.

• Method 2

1) Set the mode switch to PGM position.

2) Turn off the AC switch.

3) While holding down JOURNAL FEED key and RECEIPT FEED key, turn on the AC switch.

2. Master reset (All memory clear)

There are two possible methods to perform a master reset.

• MRS-1
Used to clear all memory contents and return machine back to its initial settings. return keyboard back to default. for default keyboard layout.

Procedure-1 (with SRV key)

1) Unplug the AC cord from the wall outlet.

2) Set the MODE switch to the (SRV') position.

3) Plug in the AC cord to the wall outlet.

4) While holding down JOURNAL FEED key, turn to (SRV) position from (SRV') position.

Procedure-2 (without SRV key)

1) Turn the mode switch to the (REG) position.

2) Ensure the batteries are not installed in the battery compartment and insert the plug into the outlet.

3) The right most decimal point will blink for a few seconds.

4) The register will sound three beeps.

5) The register will display " L   Ü.ÜÜ ."

3. RAM control
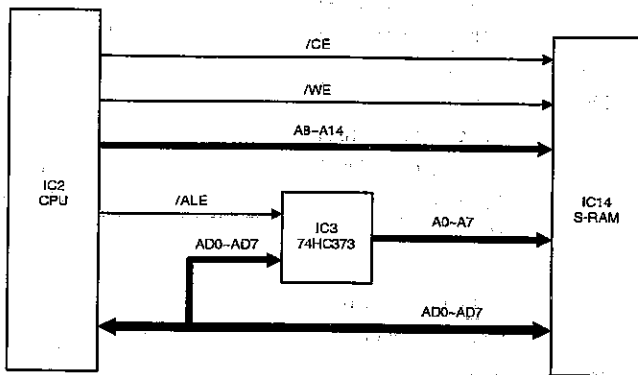

/WE: Write signal
When the signal is low, writing is performed. When the signal is high, reading is performed.

/CE: Chip select signal

A8-A14: Address bus

AD0-7: Address/Data bus

A0-1: Address bus signal

/ALE: Address latch signal

Address signals A0-A7 are used commonly with the data bus. When the address latch signal /ALE is input to IC3, the address/data bus signal AD0-AD7 access the RAM as address signals A0-A7.

(READ)

As shown in the attached time chart, address signals are outputted from P20-P27, P111-P117, and the lower address is latched with P32. The modes at P20-P27 are changed to the input mode. The chip enable signal (P31) is output for the RAM. Then the output data from the RAM are read from P20-P27.

RAM control

(READ cycle)
(WRITE)

As shown in the attached time chart, address signals are outputted from P20-P27, P111-P117, and the lower address is latched with P32. The write enable signal (P30) is output. The write data to the RAM are output from P20-P27. Then the chip enable signal (P31) is output to write the data.

RAM control

(WRITE cycle)
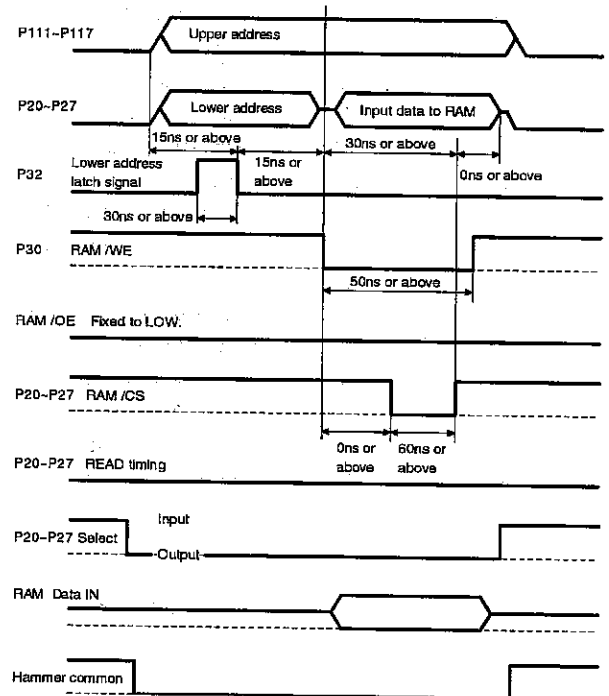

4. Printer control circuit (ER-A310)

1) Printer motor drive circuit
The motor drive signal MD from the CPU is used to operate the printer motor with switching operation of transistor Q17.

2) Print wheel drive circuit
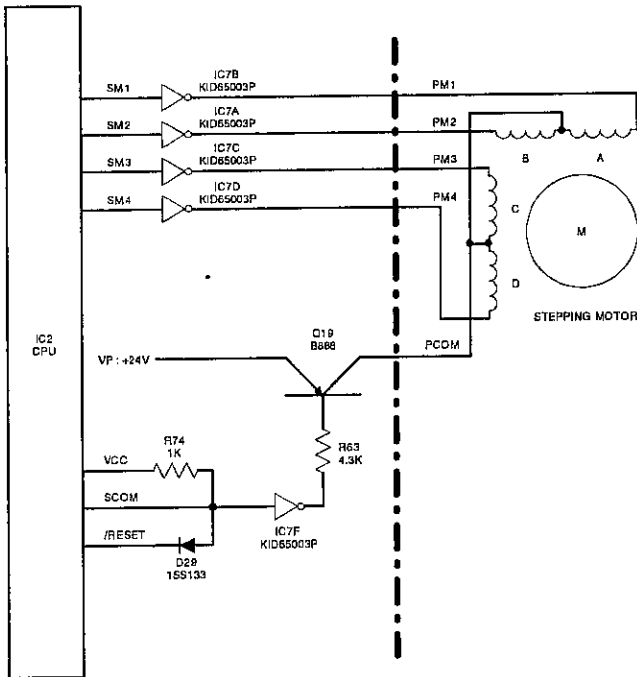

The stepping motor is used to drive the printer wheel.

The common signal SCOM from the CPU is used to supply voltage VP to the stepping motor with the switching operation of transistor Q19, and the stepping motor solenoid drive signal is used to operate the stepping motor.

3) Print solenoid drive circuit
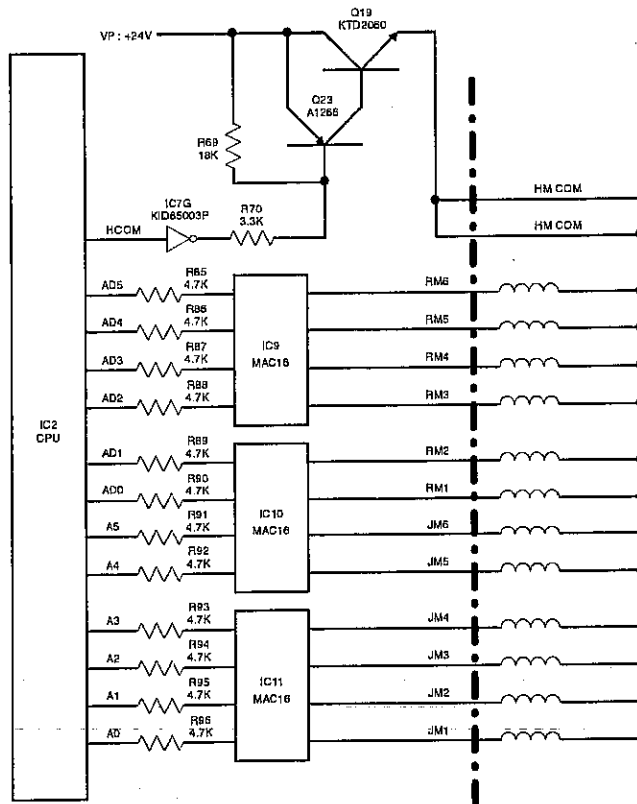

Since the address bus is used to drive the print solenoid, an access to the RAM cannot be performed during printing. The common voltage of the print solenoid is supplied by switching operations of transistors Q23 and Q19 with the HCOM signal.

4) Paper feed solenoid and stamp solenoid drive circuit
PF: Paper feed solenoid drive signal (Receipt side)

JF: Paper feed solenoid drive signal (Journal side)

STAMP: Stamp solenoid drive signal (Receipt side)

5) Timing signal circuit
5. Printer motor drive circuit (ER-A330)

1) Printer motor drive and brake circuit
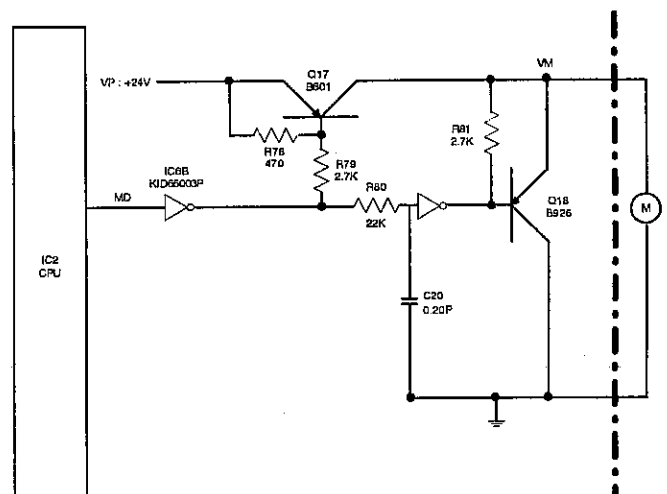

The printer motor is operated by switching operation of transistor Q17 with the motor drive signal MD from the CPU.

2) Print solenoid drive circuit
Since the address bus is used to drive the print solenoid, an access to the RAM cannot be performed during printing. The common voltage of the print solenoid is supplied by switching operations of transistors Q23 and Q19 with the J-COM signal and the R-COM signal.

3) Paper feed solenoid and stamp solenoid drive circuit
PF: Paper feed solenoid drive signal (Receipt side)

JF: Paper feed solenoid drive signal (Journal side)

STAMP: Stamp solenoid drive signal (Receipt side)

4) Timing signal circuit
The timing signal α is delivered to the CPU by the photo transistor attached to the printer.

6. Drawer drive circuit
The solenoid is driven by switching operation of transistor Q14 with the drive signal DR1 from the CPU.

When an option drawer is used, the parts enclosed with the dotted line must be attached to the PWB.

7. Keyboard circuit
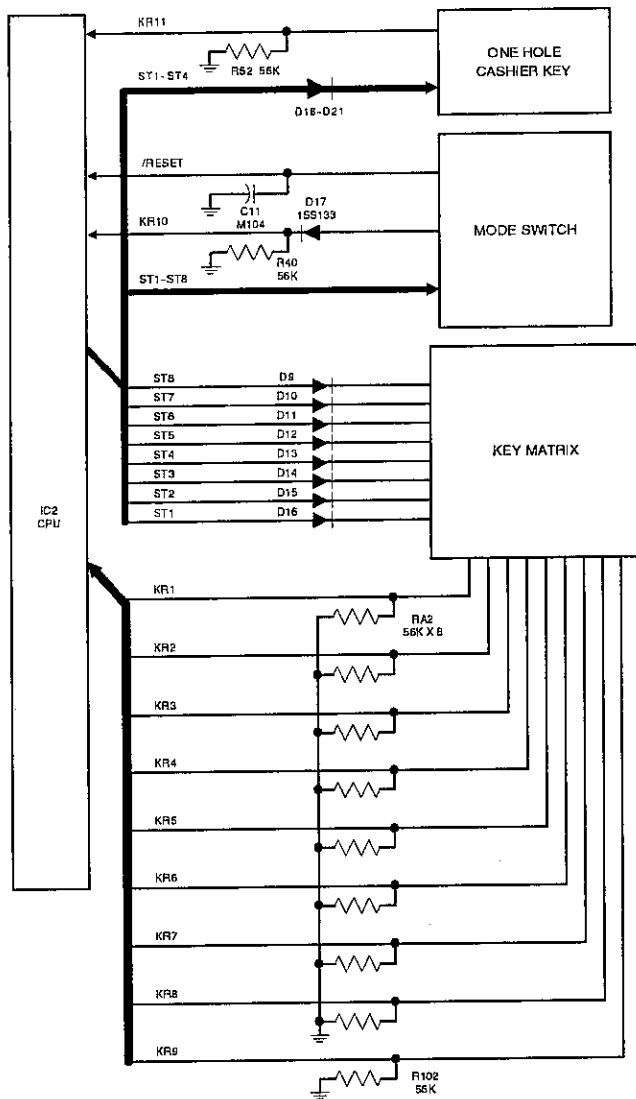

The keyboard performs key scanning with the eight strobe signals ST1-ST8, and returns the nine return signal KR1-KR9 to the CPU.

The mode switch performs scanning with the eight strobe signals ST1-ST8, and returns the return signal KR10 to the CPU. When the mode switch is at SRV position, the reset signal /RESET is outputted.

The one hole cashier switch performs scanning with four strobe signals ST1 ~ ST4, and returns the return signal KR11 to the CPU.

8. Display circuit
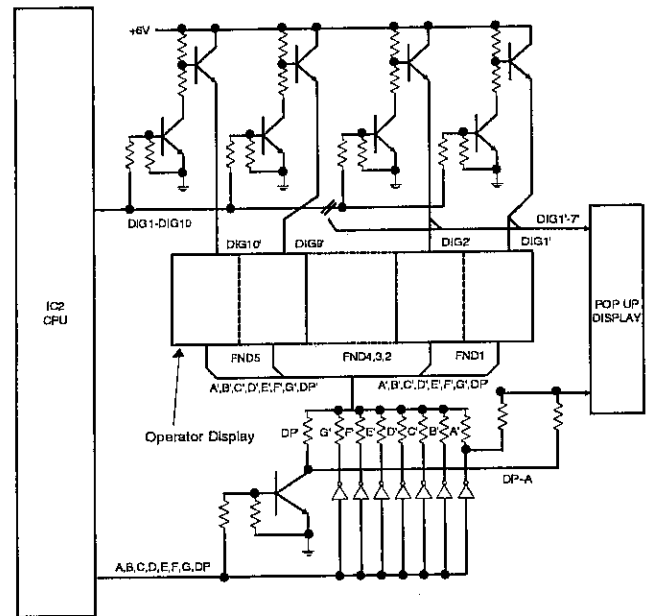

The 7-segment LED is used in the display. The operator display uses 10 digit signals, and the pop-up display uses 7 digit signals.

9. Power supply circuit
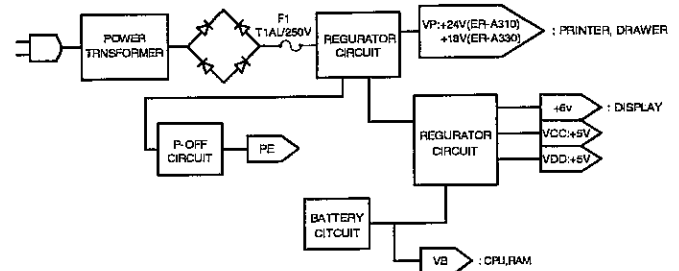

10. Battery voltage monitor circuit
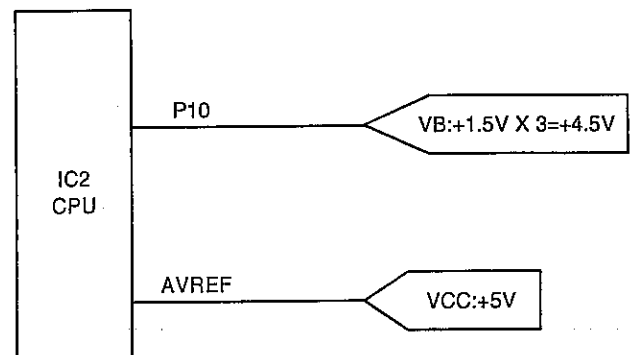

The battery voltage signal is inputted to the CPU P10 and the comparison reference voltage VCC (+5V) is inputted to the CPU VREF to monitor the battery voltage. When the input to P10 falls below 7/10VCC=+3.5V, the low battery display is made.

11. Clock generator circuit
X2:   4.19MHz is inputted as the CPU main clock.

X1:   32.768KHz is inputted as the time renewal clock.

13. Reset circuit

The reset signal is formed with VOC and VDD. The /RESET signal is also outputted when the mode switch is at SRV position.

12. Buzzer circuit

This circuit sounds buzzer with the BUS signal from the CPU.

CHAPTER 5 TEST FUNCTION

1. Start of test function

The following key operation is required in the SRV mode to start the test.

XXXX ──▶ ST
Test command

Master reset is required when the system is to be started for the first time.

2. List of test commands

No.	Test contents	Key operations
1	Mode switch test	1 → ST
2	One hole cashier SW test	8 → ST
3	Keyboard test	XXXX02 → ST
4	Display and Buzzer test	3 → ST
5	Standard Drawer test	4 → ST
6	Option Drawer test	14 → ST
7	Printer test	5 → ST
8	RAM test	6 → ST
9	Battery voltage test	7 → ST

NOTE-1: Test message is printed on the journal

NOTE-2: The contents of the totalizer and the preset values are not erased by the test.

3. Test function

1) Test No. 1: Mode switch test

① Key operation

1 ──▶ ST

Then, turn the mode switches in the following order.

✻ In the mode switch test, turn the switch rhythmically.

MODE: SRV→PGM→VOID→OFF→OP X/Z→REG→MGR→X1/Z1→X2/Z2→SRV

DISPLAYE: (0) → (1) → (2) →OFF→ (3) → (4) → (5) → (6) → (7) → (0)

② Description
As the mode switch position number is displayed, check the number.

③ Termination
The test can be terminated when the mode switch is turned to the SRV side from other position.

Termination print at normal end   0 1

2) Test No. 2: One hole cashier key test

① Key operation

8 ──▶ ST

② Details of the test
Insert the cashier key, and the key code will be displayed.
- Set the mode switch to another position than SRV to complete the test.

③ Check item

Insert the cashier key from 1 sequentially.

④ Test end

If it comes to the right turn, "   08" is printed and the operation is terminated.

If it comes to a wrong turn, the error print "✻✻✻✻ 08" is printed.

3) Test No. 3: Keyboard test

① Key operation

X X X X 02 ──▶ ST

Sum check data
(1) Enter the test command in succession to the sum check data of the model.

Model name	Sum check data (Standard keyboard data)
ER-A310	2282
ER-A330	3017

✻NOTE: Sum check data
The check sum is a decimal number obtained by converting the hard code hexadecimal total of all keys.
The TL/NS key are the exception.

(2) Next, push every key on the keyboard except for the receipt and journal keys.
When the TL/NS key is pressed, the termination printout is immediately produced assuming that all keys have been pressed.
There is no order in which the keys have to be depressed.
Display: 02   XX ← XX = position code.

4) Test No. 4: Display and buzzer test

① Key operation

3 → ST

② Description
Continuous beeps and the display are tested.

```
1. 2. 3. 4. 5. 6. 7. 8. 9. 0.
```
State of display

The decimal point is shifted digit by digit from the lowest digit (every 200 msec).
Then all segments are lighted (for about 1 sec).

```
8. 8. 8. 8. 8. 8. 8. 8. 8. 8.
```
State of display

Pressing any key will terminate the test.

③ Check items
Check that each position display is correct.
Check that the display is even and uniform.
Check that the buzzer sound is normal. (No interruption and vibrations of sounds.)

④ Test end

End print   0 3

5) Test No. 5, 6: Drawer open test

① Key operation

4 → ST : For stardard drawer

14 → ST : For option drawer

② Description
With this test, the drawer opens and its state is displayed in the following manner:

Drawer open   → | XX   0 |

Drawer closed → | XX   C |

XX = 04 or 14

✻ When the model that has no drawer sensor switch, displayed is "C".

③ Termination
With depression of any key

Termination print   04 (For standard drawer)
                               14 (For Option drawer)

6) Test No. 7: Continuous print test

① Key operation

5 → ST

② Description
The continuous printing as shown below is performed.

③ Termination
After pressing any key, one-cycle of printing is performed before completing the operation.

7) Test No. 8: RAM test

① Key operation

6 ⟶ ST

② Test content

The RAM of 256KByte (standard provision) is checked.
Read and write of each data are made to the addresses shown in the table below to compare the data. If there is no error, the machine returns to the key wait state. If an error occurs, intermittent buzzer sounds are made and the error print is made. Press any key to cancel the error.

8) Test No. 9: Battery voltage test

① Key operation

7 ⟶ ST

② Details of test

By the above key operations, the battery voltage is checked with the A/D conversion circuit of CPU and the following display is made.

✳✳✳

Voltage conversion value when the reference voltage Vref (+5V) is supposed to 256.

③ Check item

Display check item

(Example) If the battery voltage is +3 V, $256 \times 3/5 = 153$ is displayed.

④ Test end

Pressing any key will make the following print and terminate the test.

End print   07
(Note) Specified value: 3.0 V
